Where Did That Download Come From?

If you download a file from the web, you can usually find out exactly where that downloaded file came from (including the exact web address) by pressing Command–I when you have the file selected. Once the info dialog appears, click on the right–facing arrow beside More Info to expand that panel and it will display a Where from header, and to the right of that it will show the exact web address from which the file was originally downloaded.
